Recognising Acute Angles

Year 4 | Mathematics · Measurement | Worksheet A1 · Angle Foundations

Name: _____ Date: _____

LEARNING INTENTION

I can recognise acute angles by comparing their opening with a right angle.

KEY IDEA

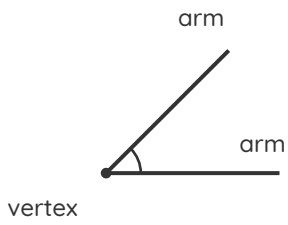
An acute angle is smaller than a right angle. It is greater than 0° and less than 90°.

VOCABULARY

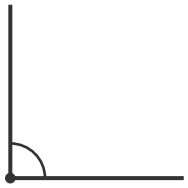
angle · arms · vertex · opening · acute angle · right angle

LEARN IT: A Worked Model

An angle is formed where two arms meet. The meeting point is the vertex.
Compare the marked opening with a square corner (a right angle).



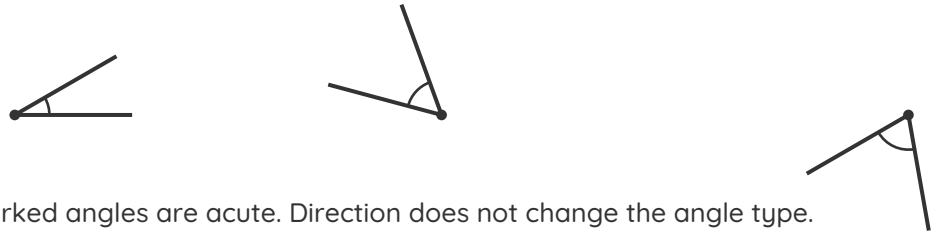
Acute angle



Right angle

The acute angle has a smaller opening. A right angle is exactly 90°.

SEE IT: Acute Angles Can Face Different Directions



All three marked angles are acute. Direction does not change the angle type.

SUCCESS CRITERIA

- ☐ I can compare an opening with a right angle.
- ☐ I can identify acute angles in different directions.
- ☐ I can explain why arm length does not decide angle size.

NOTICE IT: Question 1

Circle the acute angle. Compare each marked opening with a square corner.

Acute Angles: Practise, Apply and Reason

Year 4 | Worksheet A1 | Use the marked opening. You do not need a protractor.

PRACTISE IT: Question 2 - Identify Acute Angles

Write YES if the marked angle is acute. Write NO if it is not acute.

A.

Answer: _____

B.

Answer: _____

C.

Answer: _____

D.

Answer: _____

E.

Answer: _____

F.

Answer: _____

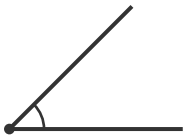
APPLY IT: Question 3 - Draw an Acute Angle

Use a ruler to draw two arms meeting at the dot. Make the opening acute.
Mark the opening with a small curved line. Label the vertex.

EXPLAIN HOW YOU KNOW: Question 4 - Find the Mistake

Mia says, "Angle B is larger because its arms are longer." Is she correct?

Angle A



Angle B

Explain what decides the size of an angle.

CHALLENGE: Question 5

An angle turns to face another direction. Its opening stays the same.
Could it change from acute to right? Explain.

MY SELF-REVIEW

Teacher Copy: Recognising Acute Angles

Year 4 | Worksheet A1 | Answers, misconception support and next steps

ANSWER KEY: Page 1

Notice It - Question 1: B is acute. A is right; C is obtuse.
The marked opening of B is smaller than a right angle.

ANSWER KEY: Page 2

Question 2: A - YES; B - NO; C - YES; D - NO; E - YES; F - NO.
A, C and E are acute. B and F are right angles. D is obtuse.
Question 3: Answers vary. Accept two arms meeting at the dot, with a marked opening greater than 0° and less than 90°. The vertex label points to the dot.
Question 4: Mia is incorrect. Both marked openings are equal and acute. Longer arms do not make an angle larger. Angle size depends on the turn or opening between the arms.
Question 5: No. Turning the whole angle does not change its opening, so it remains acute. A right angle would need a larger opening.

COMMON MISCONCEPTIONS

1. Longer arms mean a larger angle. Compare Question 4 using tracing paper or overlay the two angles; their openings match.
2. An acute angle must point upwards. Rotate the page and ask whether the marked opening has changed.
3. Every small-looking diagram is acute. Compare the opening, rather than the size of the printed diagram.

TEACHER PROMPTS AND SUPPORT

Use the corner of a rectangular piece of paper as a right-angle checker. Place the corner at the vertex and align one edge with one arm. Ask: "Is the marked opening smaller than, equal to, or larger than this corner?"
Read the degree definition aloud if needed; degree measurement is not required to complete this introductory recognition worksheet.

NEXT-STEP GUIDANCE

Ready: move to identifying and comparing right and obtuse angles.
Needs support: repeat square-corner comparisons using rotated examples.
Printing: A4, actual size. Diagrams are vector-drawn; students do not measure them.
