How Objects Move

Look, Talk & Explore

FOUNDATION Science

AC9SFU02 | Movement: shape, size and material.

Name: _____
Date: _____

Learning Intention: I can watch and describe how objects move.

I can ...

- ☐ describe a movement.
- ☐ test a ball and a block.
- ☐ talk about what I noticed.

Words to say

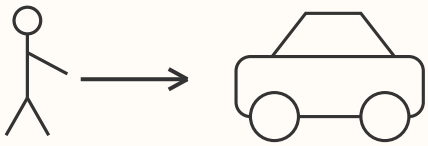

roll
turn over and over

slide
move along without rolling

shape
how an object is formed

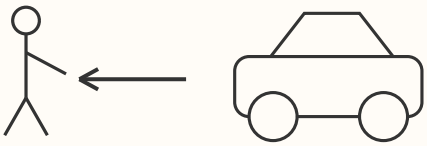

See It: Move a Toy

PUSH - move it away

You can give a toy car a gentle push.

PULL - bring it closer

You can give a toy car a gentle pull.

NOTICE + TRY IT

A push or pull can start a toy moving.
Try a gentle push. Watch the wheels turn.
What moved? Show or tell an adult.

Adult: Model pushing away from you and pulling towards you.
Use a large toy; keep fingers clear of moving parts.

How Objects Move

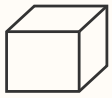

Practise, Explore & Share

Adult: Read aloud. Children may point, circle, draw or tell you.

You need: a large ball, a block, a toy car and a low ramp.

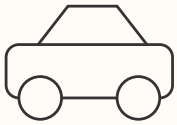

A. Watch It Move

1. Try each object on the floor.
Point to one that rolls. Tell how it moves.

B. Try a Push and Pull

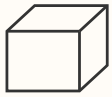

2. Push a toy away. Pull it closer.
Draw an arrow to show one movement.

C. Predict, Then Test

3. Which might roll down the ramp?
Circle your prediction.

ball

block

D. What Happened?

4. Let each object go from the same spot.
Do not push it.
Tell what each did. Circle or add words:
rolled slid tumbled stayed
My other word: _____

E. Think About Shape

5. Feel the ball and the block.
Show a curved part and a flat part.
What might help the ball roll?

F. Draw + Share

6. Draw one object you tested.
Tell how it moved. Did it match your prediction?

My Self-Review

☐ I can show it. ☐ I am still learning. ☐ Please help me.

My discovery: _____

Answers + Acceptable Guidance

1. After testing, a typical ball rolls. Accept observations such as the block sliding, tipping or tumbling; its movement depends on its shape, orientation and the surface.

2. Check the actions: push away from the child; pull towards the child. Accept an arrow matching the action the child shows.

3. A prediction is not marked right or wrong. A ball is a reasonable prediction for rolling; ask the child why.

4. Record what actually happens. Accept more than one movement for an object. Repeat if the observation is unclear.

5. A ball has a curved surface. A typical cube-shaped block has flat faces. The curved shape helps a ball roll.

6. Accept an identifiable drawing or adult-labelled mark-making, an observed movement word and an oral comparison with the prediction.

Page 1 - NOTICE: The car moves; its wheels roll or turn. A gentle push or pull may start it moving. Accept a demonstration or spoken response.

Misconception Support

Misconception	What to explain	Prompt to try
All objects move in the same way.	Objects may roll, slide, tumble or stay still.	What did this object actually do?
A block can never roll.	Some blocks tip or tumble; shape and position matter.	Shall we try a different face?
My prediction must be right.	A prediction is an idea to check.	Was your observation the same or different?

Parent / Teacher tip: Use large objects and a low, stable ramp with a clear landing space. Supervise closely. A wooden ball and wooden cube help focus the comparison on shape; if materials differ, do not claim shape is the only cause.

Next step: Compare two large, similar-shaped balls of different sizes or materials. Keep the ramp and release point the same. Describe actual movement; avoid a universal rule that bigger always means faster.

Curriculum scope: AC9SFU02 describes movement and how size, shape or material influences it. This introductory set focuses on shape. Push and pull are simple actions here; detailed force strength and direction are developed in Year 1.
